HANDOVER

Your store, handed over

Everything you need to run MadLabsoiL: where it lives, what you own, what to change today, and how to use it day to day. Keep this file somewhere safe.

WHAT	ADDRESS	USED FOR
Your shop	`https://madlabsoil.net`	What customers see
Your admin	`https://madlabsoil.net/admin`	Products, orders, discounts, settings
Payment server	`https://pay.madlabsoil.net`	Customer payments: Bitcoin, ETH, USDC and more, and Monero. Money goes straight to your own wallets
Cloudflare	`dash.cloudflare.com`	Your domain, security firewall, DNS
Brevo	`app.brevo.com`	Sends order emails from orders@madlabsoil.net
UltaHost	`ultahost.com`	The server your store runs on
GitHub	`github.com/madlabsoil`	Your store's code, which deploys itself when changed

1. Do these today

These make sure everything is in your name and only you hold the keys. Tick them off as you go.

- ☐ **Test order:** place one small order with your own email and pay it (Bitcoin, or USDC to try the exchange too). Check that it turns to *Paid: to ship* in your admin and that both emails arrive.
- ☐ **Store admin:** sign in, open *Overview*, press *Change password*. Use four or five ordinary words and keep it in your password manager.
- ☐ **Payment server:** sign in at pay.madlabsoil.net with the login you were sent, then change the password under your account.
- ☐ **Cloudflare:** change your Cloudflare password (it was used to set up the security rules).
- ☐ **UltaHost:** change your account password (it was shared in chat during setup).
- ☐ **GitHub:** accept the repository transfer email from GitHub, so the store's code sits in your account.
- ☐ **Encryption keys:** save the "store keys" you are sent through a one-time link in your password manager. Without them, a copy of the database cannot be read, by anyone.
- ☐ **Backup key:** make sure your `store-key.txt` (the file starting `AGE-SECRET-KEY-1`) is in your password manager. It is the only key that opens your backups and exports.

Never send passwords, your seed phrase, store-key.txt or the store keys in a chat message or an email. If someone asks for them, it is not us.

2. What you own

ACCOUNT	IN WHOSE NAME	ACCESS WE HAD	AFTER HANDOVER
Store admin	You (madlabsoil@proton.me)	A setup login	Setup login deleted
Payment server	You	Admin during setup	Your own admin login; ours removed
Cake Wallet (store wallet)	You only	Never. We only had the public key, which can see payments but never spend	Unchanged
Cloudflare	You	Your login, shared for setup	You change the password
Brevo	You	Team member	Remove us under Settings, Users
UltaHost and the server	You	A server key for deployments and fixes	Our key removed
GitHub repository	You (madlabsoil)	Owner during the build	Transferred to you
Backup key (store-key.txt)	You only	Never. We only had the public line	Unchanged

3. Running the store

Overview page

The first page of your admin shows what needs you today: orders to ship, orders waiting for payment, sales over the last 30 days, payments for the wrong amount and products running low. *Store setup* shows what is switched on; anything without a green tick still needs doing. *View shop* opens your store; the moon/sun button switches between light and dark.

Orders

1. *Orders, To ship* lists everything that has been paid.
2. Open an order to see the delivery address. Every time an address is opened, it is recorded.
3. Post it, type the tracking number, press *Mark shipped*. The customer is emailed the tracking number.
4. When it has arrived, press *Mark as delivered*. If you forget, the store does it for you a set number of days after shipping.

Also on an order: *Cancel* (unpaid orders), *Reopen for payment*, *Mark as refunded* (after you send the Bitcoin back from your wallet, including returns), *Resend the latest email*, and a private *Staff note* (never put customer details in it).

Wrong amount paid: Bitcoin payments are sometimes a little under or over. The order says "Paid too little" or "Paid too much". Contact the customer or refund the difference.

How an order shows its total: every order, in your admin, in the emails and on the customer's pages, lists each item with its price; when a bulk price applied it shows the normal price crossed out. Each discount has its own line ("Order discount (20%)", "Discount code"), and shipping says "Free" when the order qualified.

Products

- *Add a product*: name, description (blank line between paragraphs), price, stock. New products start hidden; tick *Visible in the shop* when ready.
- *Photos*: JPEG, PNG or WebP up to 10 MB. The hidden details phones add, including GPS location, are removed before saving.
- *Bulk prices*: up to three rows of "buy at least N, pay X each", for example 10 or more at $20. Shown on the product page and applied by the cart.
- Customers can order up to 99 of a product, or your stock if lower. Untick *Count stock* for made-to-order items.
- There is no delete: untick *Visible in the shop* instead, so old orders keep their history.

Discounts

- **Discount codes** (admin, *Discount codes*): percentage or fixed amount, optional minimum spend, limit on uses and dates.
- **Discounts by order total** (admin, *Settings*): up to three rows such as $500 for 10% off and $1000 for 20% off. They apply after bulk prices, the highest reached counts, and a code still works on top. The cart shows

customers how much more they need.

Shipping and settings

- Flat shipping per order, and free shipping over an amount (currently $15, free over $300).
- Store name, shown in the browser tab and on every page.
- Your logo: *Settings*, *Logo*. Upload a PNG, JPEG or WebP (a wide PNG with a transparent background works best). Change it any time. For the payment page, upload the same file in the payment server under the store's *Branding* settings.
- Your Privacy, Terms and Shipping pages: *Pages* in the admin. They are final as approved; edit them any time.

4. Payments

When a customer checks out, they pay an invoice on `pay.madlabsoil.net`, in Bitcoin or, through *ETH, USDC & more*, in another coin that the Trocador exchange turns into Bitcoin on the same page (the customer pays its fee). Either way the money goes straight to your store wallet in Cake Wallet: the store never holds it and cannot spend it. When the payment confirms, the order turns to *Paid: to ship*, stock goes down and the customer is emailed.

PAYMENT METHOD	STATUS	MONEY GOES TO
Bitcoin	Live	Your store wallet in Cake Wallet
ETH, USDC & more (Trocador)	Live; the customer pays the exchange fee	Your store wallet in Cake Wallet, as Bitcoin
Monero	Installed and connected to your view-only wallet. It switches on as soon as the payment server finishes downloading Monero's history, then it is tested with a real payment.	Your Monero wallet
Lightning	Installed, switched off. It needs a payment channel funded with a small amount of your Bitcoin before customers can use it.	Your Lightning balance on the payment server

- An unpaid invoice expires on its own after 2 hours; the order is marked expired.
- Refunds are sent by you from Cake Wallet; then press *Mark as refunded* on the order.
- Never share your Cake Wallet seed phrase with anyone, including us.

5. Privacy: what the store keeps, and for how long

- Customers give only a name, an email and a delivery address. No phone, no date of birth, no account needed.
- Those details are encrypted the moment an order is placed. A copy of the database is unreadable without the store keys.
- A set number of days after an order is finished (Settings, currently 30), its name, email and address are deleted automatically. Your sales totals are kept, without names.
- **Exports:** *Export* in the admin downloads every current order, locked to your backup key. Open it on your computer with `age -d -i store-key.txt export-file.age > orders.json`.
- While *Only delete orders that have been exported* is ticked in Settings, details are only deleted after they have been in an export. Download an export regularly, or untick it.
- Every night an encrypted backup is made, locked to the same key and kept for the same number of days.

6. Security

- The site sits behind Cloudflare Pro: a firewall blocks common attacks, the checkout page asks visitors to confirm they are human, and repeated form submissions are slowed down.
- The server only accepts traffic from Cloudflare, signs in by key only, bans repeated failed logins and installs security updates every night.
- The admin locks for 15 minutes after five wrong passwords.
- The store loads nothing from other websites: no analytics, no ads, no tracking. Emails carry no tracking either.
- An automatic security scan of the server software and the admin runs every week.

7. What runs on its own

WHEN	WHAT
Every 5 minutes	Missed payments are picked up; waiting emails are sent
Every night, 02:45 UTC	Encrypted backup
Every night, 03:30 UTC	Old customer details deleted; shipped orders marked delivered after the set days
Every night	Server security updates
Every week	Security scan

8. If something looks wrong

Note the order number and the time, and get in touch through Fiverr. Ongoing care (updates to the server and payment software, backup checks, small fixes) is available as a monthly plan at $250 per month, if you want it.
